Necessary and sufficient conditions (denoted as) are found for OLS slope coefficients from a cross section to consistently estimate the first derivatives of the macro function. As embodies both sets of aggregation assumptions known; linear aggregation and sufficient statistics, and thus represents generalized aggregation conditions. A methodology is given for estimating second order derivatives of the macro function from cross section data for distributions of the exponential family, which extends to higher order derivatives. Finally, a general test of linear aggregation schemes is described. About the Publisher Forgotten Books publishes hundreds of thousands of rare and classic books.
